

Automated Log Monitoring and Alert System

Overview

This project is a Python-based automated log monitoring system. It reads log data and detects suspicious activity such as repeated failed login attempts.

Project Objective

The goal of this project is to demonstrate how security automation can reduce manual log review and improve threat detection.

Features

- Reads log files
- Detects repeated failed login attempts
- Generates alert messages
- Demonstrates basic security automation using Python

Technologies Used

- Python 3
- GitHub
- Basic pattern matching

How to Run

1. Download or clone this repository.
2. Make sure Python 3 is installed.
3. Open the project folder.
4. Run:

```
python log_monitor.py
```

automated-log-monitoring-system / log_monitor.py

coguntunde82 Implement log monitoring for failed login attempts 2bac140 · 1 hour ago History
